

1. Scope

This document is intended to detail a typical installation and configuration of Dialogic® 2000 Media Gateway Series (DMG2000) connected directly to the PBX for use with IBM® Lotus® Sametime® Unified Telephony application.

2. Configuration Details

Listed below are the specific details related to the PBX and the gateway used in constructing the following documentation.

2.1 PBX

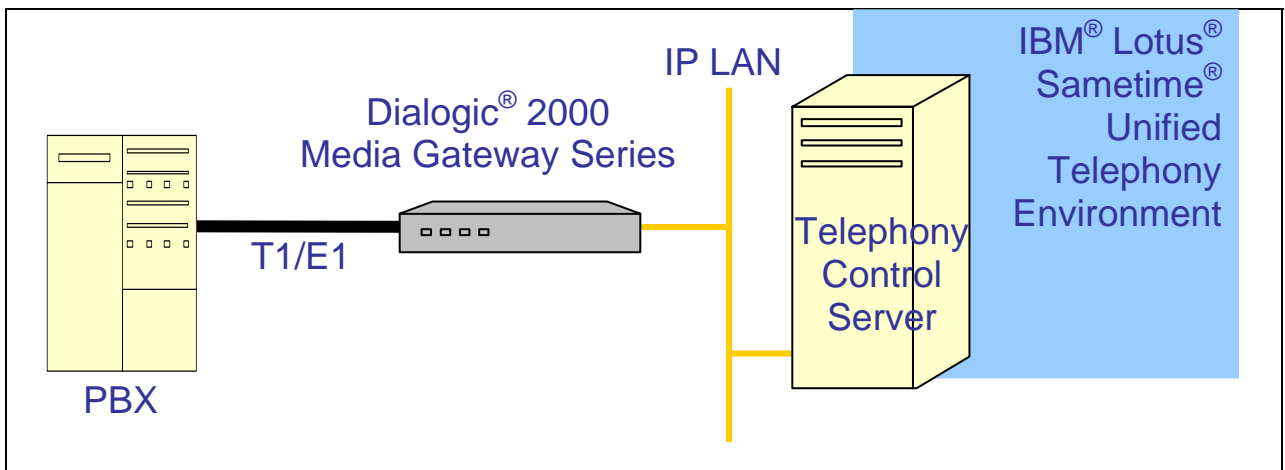

PSTN / PBX Vendor	Any
Protocol	NI2, DMS100, 5ESS, QSIG, EuroISDN

2.2 Gateway

Gateway Model	Dialogic® 2000 Media Gateway Series (DMG2000)
Software Version	Version 6.0 SU3 (6.0.128) or later
Protocol	T1/E1

2.3 System Diagram

The diagram below details the setup used in the testing and creation of the technical document.

3. Prerequisites

3.1 PBX Prerequisites

The PBX must support T1 (NI2, DMS100, 5ESS, or QSIG) or E1 (QSIG or ETSI EuroISDN).

3.1.2 PBX Cabling Requirements

Cabling for T1/E1 ISDN connections must be CAT5e or better. Standard voice quality cable will not provide optimum signal quality and the gateway will have problems establishing connection on the D-Channel.

Table 1. T1/E1 Connector Pin Designations

Pin	Description
1	RCV_RING
2	RCV_TIP
3	No Connection
4	XMIT_RING
5	XMIT_TIP
6	No Connection
7	No Connection
8	No Connection

4. Gateway Setup Notes

Steps for setting up the gateway:

- Connecting to Gateway
- Initial Gateway Configuration
- Parameter Configuration
- Routing Engine Configuration

4.1 Connecting to Gateway

There are two ways for performing the initial configuration of the gateway; serial or IP.

4.1.1 Connecting with Serial Port

- Connect a DB9 serial cable to the COM 2 port on the gateway.
- Establish a connection to the gateway (Baud=115200, Data Bits=8, Stop Bits=1, Parity=none, Flow Control=none) using a terminal emulation program (e.g. HyperTerminal). See Table 2 for the serial port pin outs.

Table 2. Serial Port Pin Outs

Pin	Signal
1	Data Carrier Detect
2	Transmit Data
3	Receive Data
4	Data Terminal Ready
5	Signal Ground
6	Data Set Ready
7	Clear to Send
8	Request to Send
9	Ring Indicator

4.1.2 Connecting with Ethernet

- Connect gateway to Network using LAN 1.
- Configure computer connecting to the gateway on the 10.12.13.x subnet (e.g. 10.12.13.75) and subnet mask of 255.255.255.0.
- Use telnet and connect to gateway at 10.12.13.74.

4.2 Initial Gateway Configuration

- Configure initial gateway. Press Enter key until you get to the “PIMG” prompt. Follow the steps below and modify the settings in **red** to match your environment. The values in **bold** are what you will be entering.

```
PIMG> pwd
Enter Password: IpodAdmin
Admin level accepted.
PIMG-admin> quickcfg
LAN 1 IP Address[10.2.2.3] : (Enter new IP Address
LAN 1 Subnet Mask[255.255.255.0] : (Enter new Subnet Mask)
LAN 1 Default Network Gateway Address[10.2.2.5] : (Enter new Default
Network Gateway Address)
LAN 2 IP Address[10.2.2.2] :
LAN 2 Subnet Mask[255.255.255.0] :
Select Line Mode ...
Valid entries:
  1. T1
  2. E1
Enter Number for Line Mode Selection [T1] : 1
Select Protocol ...
Valid entries:
  1. CAS - Loop Start
  2. CAS - Ground Start
  3. CAS - E&M Immediate
  4. CAS - E&M Delay
  5. CAS - E&M Wink
  6. ISDN - QSIG
  7. ISDN - NI-2
  8. ISDN - 5ESS
  9. ISDN - DMS-100
Enter Number for Protocol Selection [ISDN - NI-2] : 7
Saving parameters now...
Parameters successfully configured!
***** Restart Required ***** (Type 'restart')
PIMG-admin> restart
rebooting...
```

- Clear ARP Table on computer connecting to gateway (e.g. on Windows® machine, the command is “arp -d*” from a Command Shell).
- Change the IP address on the computer connecting to the gateway to match the newly configured gateway IP address.

4.3 Parameter Configuration

To get the gateway connected to the PBX for use with IBM Lotus Sametime Unified Telephony, there are a few configuration options that are required. During the solution-specific setup of the Dialogic® gateway using the web interface, you must:

- In the Config -> IP Settings page:
 - Set the BOOTP Enabled parameter to 'No' the (default is Yes) under the LAN1 settings block. LAN 2 can also be configured at this point for maintenance only.

IP Settings, LAN1	
MAC	00-a0-e6-89-10-42
* Client IP Address	10.242.202.40
* Client Subnet Mask	255.255.255.0
* Default Network Gateway Address	10.242.202.250
* BOOTP Enabled	No
* SNTP Server IP Address	

IP Settings, LAN2	
MAC	00-a0-e6-89-10-43
* Client IP Address	0.0.0.0
* Client Subnet Mask	255.255.255.0

- In the TDM -> T1/E1 page:
 - Under Select Port to Modify, leave this set to 'all ports' for now. Set the Line Encoding and Framing as required by the PBX. Typical settings for T1 are Line Encoding = B8ZS and Framing = ESF.

T1/E1 Port Selection	
Select Port to Modify	all ports

T1/E1 Configuration	
Line Settings	
* Line Mode	T1
* Signaling Mode	ISDN
* Telephony Port Interface Side	
T1 Line	
* Line Encoding	B8ZS
* Framing	ESF
* Selects Transmit Pulse Waveform	Short_Haul_110ft
T1 ISDN protocol	
* ISDN Protocol	NI-2
ISDN Protocol Variant	None
General ISDN Settings	
QSIG Protocol Specification	ISO
Network-Specific Facilities (NSF)	None
ISDN Answer Supervision Enable	Yes
Calling Type Of Number Field	Default
Calling Numbering Plan Field	Default
Called Type Of Number Field	Default
Called Numbering Plan Field	Default
Failover Settings	
* Enable Failover	Yes

- In the VoIP -> General page:
 - Set the Transport Type to match IBM Lotus Sametime Unified Telephony requirements (the default is UDP).

Voip General Settings	
User-Agent	
* Host and Domain Name	pbxgw.default.com
Transport Type	UDP
Call as Domain Name?	No
SIPS URI Scheme Enabled	No
Invite Expiration (sec)	0

- Set the Telephony Port Interface Side (either all ports or individually). If configuring the interface side for all ports on the gateway, select 'all ports' from the Select Port to Modify drop down. Then, configure the interface side to be either **Terminal** or **Network**.

NOTE: This has to be opposite of the PBX trunk configuration. So if the PBX trunk is network, then the gateway interface must be terminal.

T1/E1 Port Selection	
Select Port to Modify	all ports
T1/E1 Configuration	
Line Settings	
* Line Mode	T1
* Signaling Mode	ISDN
* Telephony Port Interface Side	Terminal
T1 Line	
* Line Encoding	B8ZS
* Framing	ESF
* Selects Transmit Pulse Waveform	Short_Haul_110ft
T1 ISDN protocol	
* ISDN Protocol	NI-2
ISDN Protocol Variant	None
General ISDN Settings	
QSIG Protocol Specification	ISO
Network-Specific Facilities (NSF)	None
ISDN Answer Supervision Enable	Yes
Calling Type Of Number Field	Default
Calling Numbering Plan Field	Default
Called Type Of Number Field	Default
Called Numbering Plan Field	Default
Failover Settings	
* Enable Failover	Yes

- If configuring each T1/E1 port on the gateway individually, please read on. Otherwise, skip to the next step. If each port on the gateway requires different interface side configurations, select the port to be configured from the Select Port to Modify drop down menu (port 2 in the example below). Then, set the Telephony Port Interface Side for port 2 (**Terminal** or **Network**).

NOTE: This has to be opposite of the PSTN / PBX trunk configuration. So if the PSTN / PBX trunk is terminal, then the gateway interface must be network.

T1/E1 Port Selection	
Select Port to Modify	Port 2
T1/E1 Configuration	
Line Settings	
* Line Mode	T1
* Signaling Mode	ISDN
* Telephony Port Interface Side	Network
T1 Line	
* Line Encoding	B8ZS
* Framing	ESF
* Selects Transmit Pulse Waveform	Short_Haul_110ft
T1 ISDN protocol	
* ISDN Protocol	NI-2
ISDN Protocol Variant	None
General ISDN Settings	
QSIG Protocol Specification	ISO
Network-Specific Facilities (NSF)	None
ISDN Answer Supervision Enable	Yes
Calling Type Of Number Field	Default
Calling Numbering Plan Field	Default
Called Type Of Number Field	Default
Called Numbering Plan Field	Default
Failover Settings	
* Enable Failover	Yes

- In the VoIP -> Media page:
 - Set the Audio Compression parameter to match IBM Lotus Sametime Unified Telephony requirements (the default is G.711u/G.711a).
 - Set the RTP Digit Relay Mode parameter to match IBM Lotus Sametime Unified Telephony (the default is RFC2833).
 - Set the RTP Fax/Modem Tone Relay Mode parameter to match IBM Lotus Sametime Unified Telephony (the default is RFC2833).
 - Set the Signaling Digit Relay Mode parameter to 'Off' (the default is On).
 - Set the Voice Activity Detection parameter to 'Off' (the default is On).
 - Set the G.711 Frame Size to match the requirement of IBM Lotus Sametime Unified Telephony (the default is 30ms).

VoIP Media Settings		
Audio		
* Audio Compression	G.711u/G.711a	
RTP Digit Relay Mode	RFC2833	
RTP Fax/Modem Tone Relay Mode	RFC2833	
* RTP Source IP Address Validation	Off	
* RTP Source UDP Port Validation	Off	
Signaling Digit Relay Mode	Off	
Voice Activity Detection	Off	
RFC 3960 Early Media Support	Always	
	Codec	Frame Size
	G.711	30
	G.723.1	30
	G.729AB	10
		Frames per Packet
		1
		1
		3
Fax		
* Fax IP-Transport Mode	T.38	
SRTP		
* SRTP Preference	RTP_Only	
MKI on Transmit Stream	Yes	
Key Derivation Enable	Yes	
Key Derivation Rate	16	
Anti-replay window size hint	64	
Cipher Mode	AES_Counter_Mode	
Authentication Type	SHA1	
Authentication Tag Length	SHA1_80_bit	

4.4 Routing Engine Configuration

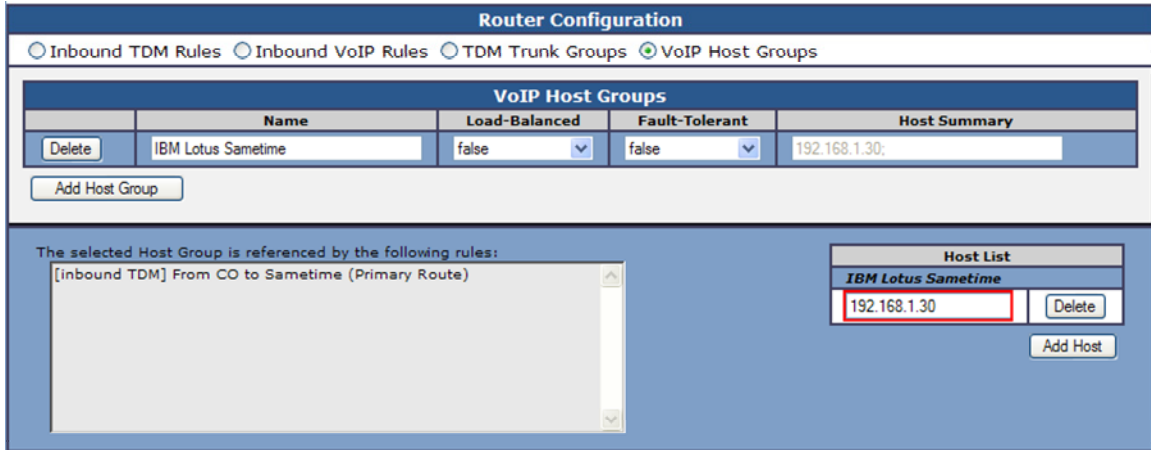

In this step, we will configure the routing table to handle inbound TDM calls destined for IBM Lotus Sametime Unified Telephony VoIP, as well as inbound VoIP calls destined for the PBX / PSTN.

NOTE: For all the examples in this document going forward the term 'inbound call' refers to a call in the TDM to IP direction and the term 'outbound call' refers to a call in the IP to TDM direction.

4.4.1 Gateway Connected to PBX

- **VoIP Host Group** - The first item is to set up the IP address (IBM Lotus Sametime Unified Telephony Control Server) to use as our IP destination for inbound calls to IBM Lotus Sametime Unified Telephony Control Server. This is done in the routing table under the section VoIP Host Groups. We define a single host group (using the default group is fine) that includes the IP address of the IBM Lotus Sametime Unified Telephony Control Server; in our example case we are using the IP address 192.168.1.30 for this.

NOTE: If using redundant Telephony Control Server (TCS) for use with load balancing or failure tolerance, add the IP address of the redundant TCS to the Host List by clicking on Add Host.

The screenshot shows the 'Router Configuration' interface with the 'VoIP Host Groups' section selected. A table lists the host group 'IBM Lotus Sametime' with 'Load-Balanced' and 'Fault-Tolerant' options set to 'false'. The 'Host Summary' column shows the IP address '192.168.1.30'. Below the table is an 'Add Host Group' button. A text box indicates the host group is referenced by the rule '[inbound TDM] From CO to Sametime (Primary Route)'. To the right, a 'Host List' table shows the IP address '192.168.1.30' with a 'Delete' button and an 'Add Host' button below it.

	Name	Load-Balanced	Fault-Tolerant	Host Summary
Delete	IBM Lotus Sametime	false	false	192.168.1.30

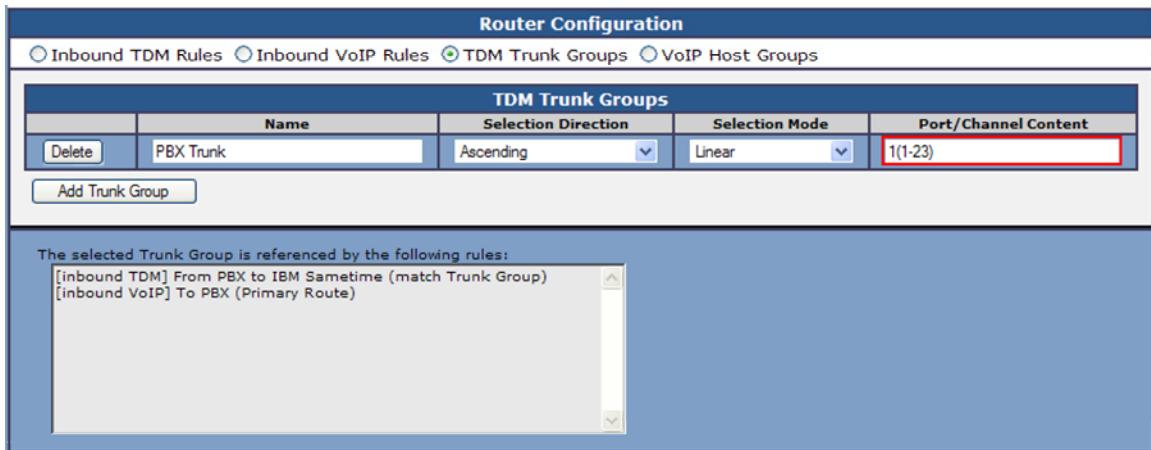

Add Host Group

The selected Host Group is referenced by the following rules:
[inbound TDM] From CO to Sametime (Primary Route)

Host List	
IBM Lotus Sametime	
192.168.1.30	Delete

Add Host

- **TDM Trunk Groups** - The second item we need to configure is the TDM Trunk Group. This is what the gateway will use to route calls to the PBX. This is done in the routing table under the section TDM Trunk Groups. We define a trunk group that includes the Port / Channel that will be used to make outbound calls to the PBX. In our example below, we have one trunk group configured for all PBX bound calls - 1(1-23).

The screenshot shows the 'Router Configuration' interface with the 'TDM Trunk Groups' section selected. A table lists the trunk group 'PBX Trunk' with 'Selection Direction' set to 'Ascending' and 'Selection Mode' set to 'Linear'. The 'Port/Channel Content' column shows '1(1-23)'. Below the table is an 'Add Trunk Group' button. A text box indicates the trunk group is referenced by the rules '[inbound TDM] From PBX to IBM Sametime (match Trunk Group)' and '[inbound VoIP] To PBX (Primary Route)'. The 'Port/Channel Content' field in the table is highlighted with a red box.

	Name	Selection Direction	Selection Mode	Port/Channel Content
Delete	PBX Trunk	Ascending	Linear	1(1-23)

Add Trunk Group

The selected Trunk Group is referenced by the following rules:
[inbound TDM] From PBX to IBM Sametime (match Trunk Group)
[inbound VoIP] To PBX (Primary Route)

- Inbound TDM Rules** - When an inbound call comes in to the gateway from the PBX, an Inbound TDM rules need to be defined in order to route the call to its proper destination. In our example, when using IBM Lotus Sametime Unified Telephony with the gateway behind the PBX, create the following rule:

From PBX to IBM Sametime

Inbound TDM Rules
 Inbound VoIP Rules
 TDM Trunk Groups
 VoIP Host Groups

Inbound TDM Rules				
Select	Enable	Rule Label	Request Type	Trunk Group
	<input checked="" type="checkbox"/>	From PBX to IBM Sametime	Any	PBX Trunk

Detailed Configuration for Inbound TDM Rule: **From PBX to IBM Sametime**

Inbound TDM Request Matching			
CPID Matching			
Calling Number	*	Called Number	*
Calling Name	*	Called Name	*
Redirect Number	*	Redirect Name	*

Outbound Routes			
Device Selection			
Outbound Destination	VoIP	Host Group	IBM Sametime
		Route Method	Bridged
CPID Manipulation			
Calling Number	S	Called Number	D
Calling Name	S	Called Name	D
Redirect Number	R	Redirect Name	R

Select Primary / Alternate Route

Primary
 Alt-1
 Alt-2
 Alt-3
 Alt-4

- **Inbound VoIP Rules** - When an outbound call comes in to the gateway from an IBM Lotus Sametime Unified Telephony user, an Inbound VoIP rule needs to be created in order to route the call to its proper destination. In our example, we route all outbound IP calls to the PBX and pass all received calling and called information using the following rules:

To PBX

Inbound TDM Rules
 Inbound VoIP Rules
 TDM Trunk Groups
 VoIP Host Groups

Inbound VoIP Rules				
Select	Enable	Rule Label	Request Type	Originating VoIP Host Address
<input type="checkbox"/>	<input checked="" type="checkbox"/>	To PBX	Any	*

 Alt-4

NOTE: For more information regarding configuration, please refer to the Dialogic® 1000 and 2000 Media Gateway Series User's Guide:

http://www.dialogic.com/manuals/mediagateway/UsersGuide_6x.pdf

5. Restarting Gateway

- For the configuration changes to take effect, you will be prompted to restart the gateway. Select the Restart menu option through the web interface and proceed to click on Restart Unit Now.
- After restarting the gateway, examine the T1 link in front of the gateway and make sure that the T1 LED is green. If it is yellow or red, please check your cable and gateway T1 configuration or consult with your PBX vendor. Once you have a green LED, you can begin making PSTN to IBM Lotus Sametime Unified Telephony application calls.

6. Troubleshooting

6.1 Important Debugging Tools

- Ethereal/Wireshark – Used to view and analyze the network captures provided by the Dialogic® gateway diagnostic firmware.
- Adobe Audition – Used to review and analyze the audio extracted from the network captures to troubleshoot any audio-related issues.

6.2 Important Gateway Trace Masks

These keys are helpful during all troubleshooting scenarios and should be considered keys to activate by default for all troubleshooting cases.

- `voip prot` and `voip code` – this allows the collection of all SIP-related messages as they are sent from and received by the gateway. This data is important in cases where you feel that the gateway is not able to communicate properly with the messaging server.
- `tel event` and `tel code` – This allows the collection of all circuit-side activity of the emulated station set such as display updates, key presses, light transitions and hook state changes. This data is very important in the following scenarios:
 - Call control problems (dropped calls, failing transfers, etc...)
 - Integration problems (incorrect mailbox placement, missed auto-attendant greetings etc...)
- `teldrv prot` – This allows the collection of all ISDN messages both transmitted and received on the gateways front-end interface. This data is very important in the following scenarios:
 - Call control problems (dropped calls, failing transfers, etc...)
 - Integration problems (incorrect mailbox placement, missed auto-attendant greetings etc...)
- `RouteTable (all keys)` – This allows you to look inside the routing table engine and see how matching rules and CPID manipulation rules work with respect to your call. This data is very important in the following scenarios:
 - Call routing problem (reaching the incorrect IBM Lotus Sametime Unified Telephony client or no client at all, etc...)

NOTE: Turning on all traces is not recommended. Doing this floods the debug stream with significant amounts of information that can cause delays in determining the root cause of a problem.
